

TmpTicket_place

1/13/16 I think I will deprecate this

Ok,

going through [MPAY-396](#)

Testing negative numbers.

Steps:

- I had successfully navigated 0.001 fail
- removing a zero tabbing out with 0.01 being valid.
- I then moved back to the amount field
 - I entered -6 and hit return
 - It Took 0.01

So what's going on is that the work flow is

enter valid amount, Submit button activate

Go back and make amount invalid, but submit is still active

act on active button return , click and it takes the older valid amount.

Any time the form is re edited after the submit button become valid should invalidate the form.
